

wall light three

The Smoo Wall Light Three is a slim, white, up- and down-lighting wall light with quietly contemporary styling. It incorporates the latest ultra-powerful LEDs, both white and coloured, to make it an extremely versatile light source, capable of producing gentle whites and subtle tints and shades, as well as a huge range of rich ambient colours. It is surface-mounted, requiring no recess in the wall, and is connected directly to mains wiring, without the need for external power supplies or controllers.

It is far brighter than most LED home lighting products currently available. Even in daylight it produces ample light for decorative effects. In the evening or at night a single light can paint large areas of a room with colour.

The LEDs in the light are arranged in two banks, each incorporating white, red, green, and blue types. Each of these banks is controlled independently, making it possible to project two zones of light with contrasting or complimentary colours. One bank is directed at the wall above the light, the other at the wall below. 60 different colour patterns are stored in the memory of the light, available for instant recall through single keypresses on the remote control.

The light is mains-powered (240v or 110v), and can be controlled with a simple 5-button infra-red handset. No special wiring is needed, and the light can be fitted quickly and easily in place of

conventional mains wall lights. Multiple lights in one room are controlled automatically, exchanging infra-red signals among themselves to make sure that they operate in unison.

The body of the light is made from a dense stone-like material which is made by combining acrylic plastic with gypsum plaster. It has a silky matt surface finish, and feels to the touch somewhere between smooth marble and perspex. It is only 42mm (1.65") thick, and 152mm (5.98") wide by 138mm (5.43") high. A lot of care has been taken to make the light exceptionally easy to fit on the wall.

The light can operate continuously at a maximum of 11.5 watts. It incorporates a total of 9 Lumiled Rebel LEDs, each rated with a power dissipation maximum of approximately 3.4 watts. It conforms to relevant British and EU-harmonised standards.
